

Environmental policy

“Let's do everything we can to make sure that we leave the next generation - the children of today - a world which provides them with both the living space they need and an environment which supports life and makes life worth living.”

Dr. Richard von Weizsäcker - President of the Federal Republic of Germany, 1984 to 1994

The environment and sustainability

For us, these terms aren't simply trendy concepts to be bandied about - they represent our duty towards our fellow men and the environment. This is a duty which we are eager to fulfil as we bring the concepts to life through our actions.

For example, we reuse the left-over pieces and chippings produced during cutting and further processing. Such waste is collected up, sorted, stored, processed to produce new semi-finished products in a pressing cycle suitable for the type of material, and placed back into the material cycle as regenerated materials.

In addition, the ongoing maintenance, inspection, and - if required - replacement of our high-tech machines ensure that we not only keep to the emission values defined for our production but actually manage to cut them down even further. Our aim to sustainably improve energy efficiency therefore contributes to both the preservation of our company's economic health and the upkeep of a clean environment.

Even during the development process, a high value is placed on only using products which are safe for our employees and for our environment.
