Legend

The material characteristic tables, which are based on data from our suppliers of raw materials, are intended to help you to quickly compare/ select a material. The values stated are short-term values that can be affected by processing, environmental, and application conditions. The user is solely responsible for the suitability of the selected material for the specific application.

RH Relative humidity
N.N. not named

1) The mechanical and electrical characteristics are based on a test in standard atmosphere at 23 °C/ 50% relative humidity (RH).

2) Test period 24h, linear oscillating measurement method.

3) Temperature stress for several hours; no or low mechanical stress (short-term service temperature).

4) Maximum continuous operating temperature in air: the specified temperature limit is based on the thermo-oxidative degradation ("aging") after the specified period. It does not refer to the mechanical strength of the material.

5) As the temperature decreases, the impact strength drops. The specified values are based on the most unfavourable impact load possible and do not represent absolute practical limits (lower service temperature).

6) Test standard series DIN EN 62631-3 for insulating materials, DIN EN 61340 for dissipative and conductive materials.
